Abstract

This paper presents the Stratum layer—designated 0S through 27S—as the complete visible-world architecture of the World Layer Model (WLM). Where the Dimension layer (D) generates invisible structure and the Emanation layer (E) constitutes the invisible rendering mechanism, the Stratum layer is what actually appears: the stable mismatch between D and E that produces the visible world and everything in it. Formally defined as $S = \Delta(D, E)$, each Stratum level is a distinct mode of visible world-presence corresponding to the joint operation of its D- and E-level counterparts. The 0S–27S sequence runs from the pre-world condition (0S), at which no visible world-body has yet formed, to full structural completion (27S), at which the visible world has exhausted its generative arc. The paper establishes both the individual character of each Stratum and the global architecture of the sequence, which exhibits the same four-phase structure—offset, polarity, recursion, closure—that governs the D and E layers. This is the third paper in the WLM three-layer ontological series, completing the D/E/S account.

1. Introduction: What the Stratum Layer Is

The fundamental distinction of the World Layer Model is between what generates and what appears. The Dimension layer generates; the Emanation layer renders; the Stratum layer is the visible result. This is not a causal sequence in which D produces E which

produces S as a downstream effect. It is a structural decomposition: every world-state has three simultaneously present aspects—its dimensional structure, its emanation rendering, and its stratum appearance—and the three are not reducible to one another.

The Stratum layer is defined by a single formal relationship. If D designates the dimensional structure at a given level and E designates the emanation rendering at the same level, then the Stratum at that level is

$$S = \Delta(D, E) \tag{1.1}$$

the stable mismatch between them. This definition has several immediate consequences. First, S is not D: the visible world is not identical to the structural world. Second, S is not E: the visible world is not identical to the rendering mechanism. Third, S requires both D and E—without the dimensional structure there is nothing to render, and without the rendering there is no mismatch and therefore no visible world. Fourth, and most crucially: the mismatch must be stable. An unstable mismatch does not produce a world; it produces noise. The visible world is not merely the difference between D and E but the difference that holds itself in a form coherent enough to constitute a world.

It follows that the condition $S \neq 0$ is necessary for the existence of a visible world. This is what the WLM seals designate as the Necessary Misalignment: without mismatch, without the gap between structure and rendering, there is no world. The pre-world condition 0S is precisely the condition in which this gap has not yet opened. And the closure condition at 27S is the condition in which the mismatch has run its full structural course and the generative cycle has completed itself.

All world-bodies belong to S. Objects, fields, environments, space, time as experienced, agents, meanings—all of these are modes of Stratum-presence. They are not D-structures (which are invisible) nor E-renderings (which are also invisible as such); they are the stable configurations of mismatch that D and E jointly produce and that constitute the visible world.

2. Methodology and Structural Principles

2.1 The Mismatch Ontology

The philosophical commitment underlying the Stratum layer is what may be called a mismatch ontology: visible reality is constituted not by structure itself but by the gap between structure and its rendering. This is a stronger claim than the observation that perception is always partial or that representation never fully captures its object. It is a structural claim: the gap is not an epistemic limitation but an ontological condition. Were the rendering perfect—were E to transmit D without loss—the mismatch would vanish and with it the visible world.

This is why the E-layer seal specifies that rendering is necessarily lossy. The loss is not a deficiency of the rendering mechanism; it is the mechanism's constitutive contribution to world-formation. Without loss there is no mismatch; without mismatch there is no Stratum; without Stratum there is no visible world. The lossy character of rendering is, in this sense, the ground of all appearance.

The Buddhist category of 'ignorance' (Sanskrit: *āvidyā*; Chinese: 无明) receives a structural interpretation in this framework: it is the structural deviation of S from a hypothetical perfect transparency. And the first stable formation of S—the threshold at which the mismatch achieves the coherence needed to sustain a world-body—corresponds to what the Buddhist tradition designates as *nāmarūpa*, the first differentiated presencing of name and form.

2.2 The Correspondence Structure

Each S-level is determined by the joint operation of its D- and E-level counterparts. The Stratum is not a third independent layer that could be described without reference to D and E; it is, structurally, their relationship. This means that the characterization of each S-level proceeds by identifying what kind of visible world-presence results when the corresponding dimensional structure is rendered through the corresponding emanation mechanism with the constitutive loss that characterizes that level.

The structural rule at each level can be stated as: $S_n = \Delta(D_n, E_n)$. The subscript denotes not a simple index but a structural correspondence: D_n generates the structural conditions, E_n renders them with level-appropriate loss, and S_n is the visible result of that rendering under those conditions.

2.3 Closure and the $S \rightarrow 0$ Transition

The WLM Closure Seal specifies that $S \rightarrow 0$ constitutes liberation or structural return. This requires clarification. The claim is not that liberation is achieved by reducing the visible world to nothing—a nihilistic reading that the WLM framework explicitly rejects. Rather, the $S \rightarrow 0$ transition designates the structural return to the generative origin: the condition at which the stable mismatch is no longer maintained, not because it has been destroyed but because the structural cycle has completed itself at 27S and returned to its ground. The sequence 0S–27S→0 is the complete cycle: emergence, elaboration, and return.

3. Architecture of the Stratum Layer

3.1 S as the Only Visible Layer

The claim that S is the only visible layer is the most fundamental architectural principle of the Stratum theory. It means that nothing in the visible world is D-structure directly perceived; nothing in the visible world is E-rendering directly encountered. All visibility—every object, every sensation, every spatial relation, every temporal sequence, every meaning—is a Stratum-configuration: a mode of stable mismatch between structure and rendering.

This does not imply that D and E are inaccessible. They are accessible indirectly through the S-layer that they jointly produce, in the same way that the structural properties of a medium are accessible through the waves it transmits. But the waves are not the medium, and the S-layer is not D or E. The distinction matters because it prevents a reduction of the visible world either to bare structure (which would eliminate the phenomenal character of appearance) or to bare rendering (which would make the visible world a mere projection without structural ground).

3.2 World-Stability as S-Stability

The stability of the visible world—its character as a world one can inhabit, navigate, and return to—is the stability of S. This follows from the definition: if S is the stable mismatch, then world-stability is mismatch-stability. A world in which S fluctuates rapidly or unpredictably is experienced as unstable, disorienting, or unreal. A world in which S

collapses toward zero is experienced as dissolution. The conditions for a habitable world are therefore the conditions for a stable mismatch—a Stratum that maintains sufficient coherence across the rendering cycles of the E-layer to constitute a persistent world-body.

3.3 The Four-Phase Global Structure

The 0S–27S sequence exhibits the same four-phase architecture that governs the D- and E-layers: offset (0S–3S), polarity (4S–9S), recursion (10S–26S), and closure (27S). The offset phase establishes the minimal conditions for world-appearance: the pre-world ground, the first visible deviation, the gradient of contrast, and the threshold of stable world-body formation. The polarity phase develops the temporal, causal, and field structures that give the world its basic spatial-temporal character. The recursion phase—which extends across sixteen Stratum levels—elaborates the higher-order visible structures: agency, meaning, identity, self-modification. The closure phase completes the cycle.

The extended recursion phase reflects a structural asymmetry: world-complexity increases rapidly once the basic physical and agentic structures are established. The density of the recursion phase in the Stratum sequence is not an artifact of the framework’s design but a structural consequence of the fact that higher-order visible structures (meaning, worldview, self-revision) are built on and require the prior establishment of lower-order ones.

4. The Strata Spectrum (0S–27S)

The following sections characterize each Stratum level by its visible world-presence, its structural role, its relation to the corresponding D- and E-levels, and its relation to adjacent Strata. As in the Emanation paper, content density varies: levels that introduce structurally new categories of visible world-presence receive more extended treatment; levels that are primarily elaborations of an established category are treated more concisely.

4.1 0S — Zero Stratum (Non-Appearance / Pre-World Condition)

0S is the structural counterpart of D0 and E0: the condition in which no mismatch has yet opened and therefore no visible world-body has yet formed. It is not a visible state—by definition, since the Stratum layer is the visible layer—but the structural ground from which visible states emerge. There is no boundary, no contrast, no temporal flow at 0S. It is the world before the first differentiation, the pre-appearance condition that corresponds, at the Stratum level, to the D0 non-state.

The 0S condition is structurally necessary as a reference point. Just as 0E is the rendering baseline from which all Emanation operations are offsets, 0S is the visibility baseline from which all Stratum configurations are departures. Without 0S as ground, the concept of a minimal visible deviation (1S) would have no structural meaning.

4.2 1S — Offset Stratum (Minimal Disturbance in Appearance)

1S is the first visible departure from non-appearance: a barely-formed world-trace, the structural minimum of ‘something is there.’ The mismatch between D1 and E1—the first dimensional offset rendered with constitutive loss—produces a minimal visible presence that is not yet a world but is no longer nothing. It has no spatial extension, no temporal duration, no qualitative character; it is purely the visible fact of the first structural departure from the pre-world ground.

The relation between 0S and 1S is the visible counterpart of the relation between D0 and the first offset: it is the visible difference between the absence of any world-trace and the presence of a minimal one.

4.3 2S — Gradient Stratum (Contrast-Potential World)

2S is the first structurally differentiated visible condition: gradients appear. Light/dark, near/far, presence/absence, more/less—all of these are gradient-structures that become visible at 2S as the mismatch between D2 (polarity) and E2 (gradient formation) stabilizes into a contrast field. There are no objects yet at 2S; there are not even boundaries in the proper sense. But the world now has differentiability—the structural condition without which any boundary, any edge, any distinction between one thing and another would be impossible.

2S is therefore the visible precondition for all subsequent structural differentiation. Every boundary that appears in the higher Strata has its appearance-ground in the contrast-potential established at 2S.

4.4 3S — Minimal World-Body Stratum (First Stable Appearance)

3S is the threshold where a world becomes possible. The mismatch at 3S achieves, for the first time, sufficient coherence to sustain a stable world-unit across rendering cycles: a pattern that persists rather than dissolving back into the gradient of 2S. This is not yet an object in the ordinary sense; it is the structural minimum of persistent visible presence, the smallest possible configuration of stable mismatch that can be said to constitute a world-body.

The transition from 2S to 3S is perhaps the most structurally significant threshold in the Stratum sequence. Below it, the visible conditions are necessary but not sufficient for world-formation; at and above it, the conditions are sufficient for at least minimal world-body coherence. In the language of the misalignment seals, *nāmarūpa*—the first stable formation of S—corresponds to this threshold.

4.5 4S — Temporal World Stratum (Visible Time-Flow)

At 4S, the world acquires temporal appearance: before and after, change, unfolding. Events begin to appear as sequences rather than static configurations. The mismatch between D4 (state-transition structure) and E4 (temporal rendering) produces a visible world in which time is not merely structural—as it is in D4—but experiential: the world flows, events succeed one another, and the difference between past and future is a visible structural property of the world-body.

The temporal character of 4S is the condition for all subsequent Strata that involve process, development, narrative, or change. Without the time-flow established at 4S, the causal structure of 6S, the narrative structure of 17S, and the agentive structure of 18S would have no visible temporal ground.

4.6 5S — Single-Trajectory World Stratum (Actualized Timeline)

5S is the visible world in which branching possibilities have collapsed into a single coherent timeline. The world at 5S appears as this path, not all possible paths. The

mismatch between D5 (possibility branching) and E5 (possibility compression) produces a visible world that is determinate: what has happened has happened, the path taken is the visible world, and the unchosen possibilities are absent from the visible record.

This is the Stratum-ground of the phenomenological sense of the actual as distinguished from the possible—the sense that the world is this way rather than otherwise. Without 5S, the temporal world of 4S would have no determinate direction; it would be a field of open temporal possibilities rather than a single visible timeline.

4.7 6S — Causal World Stratum (Visible Causation)

6S is the world in which events appear to follow from prior events. Causality becomes a visible property of the world at 6S: the mismatch between D6 (selection mechanism) and E6 (selection rendering) produces a visible world with directional constraint, in which prior states visibly determine the range of subsequent ones and certain outcomes appear as effects of identifiable causes.

The appearance of causality is not the same thing as causality in the structural sense of D6. D6 is the selection mechanism; 6S is what that mechanism looks like in the visible world. This distinction matters: the WLM account of causality is not an eliminativist one—it does not claim that causality is ‘merely’ apparent—but a structural one: causality as visible in the world is the Stratum-presentation of a dimensional selection structure, and neither the presentation nor the structure alone is the complete account.

4.8 7S — Field World Stratum (Spatial/Interaction Appearance)

7S is the world in which space appears. The mismatch between D7 (interaction-field structure) and E7 (interaction-field rendering) produces a visible world with spatial character: entities appear separated by distance, related by forces or interactions, and embedded in a field that has both local and global structure. The appearance of space at 7S is not the appearance of a container in which things happen to be located; it is the visible structure of relations among entities that have achieved mutual distinctness.

Boundaries, in the proper sense, first appear at 7S: the surface between one entity and another, the interface across which interaction occurs, the visible limit of one world-body and the beginning of another. These are not geometrical abstractions but structural features of the 7S mismatch-configuration.

4.9 8S — Object World Stratum (Stable Entities)

8S is where objects appear. The mismatch at 8S—between D8 (pattern structure) and E8 (pattern stabilization rendering)—produces visible entities that persist: patterns that maintain their identity across time, across interaction, and across changes in their environment. The wave propagates; the object endures; the pattern recurs. At 8S, the world is no longer merely a field of events and interactions but a field of things.

The distinction between objects (8S) and agents (10S) is structural, not merely functional. Objects persist by maintaining their pattern; agents persist by maintaining their pattern while also initiating interactions. The 8S object is stable without being active in the agentive sense.

4.10 9S — Lawful World Stratum (Regularity and Predictability)

9S is the world that appears governed by consistent rules. The mismatch between D9 (rule-system) and E9 (rule-frame rendering) produces a visible world in which patterns repeat, regularities emerge, and the behavior of objects across time and space is visibly constrained by structural invariances. This is the visible counterpart of natural law: not the abstract mathematical structure of D9 but the appearance of lawfulness in the visible world—the sense that the world is not arbitrary, that its regularities are reliable, that what has held will continue to hold.

9S is the Stratum-ground for empirical science, for the practice of prediction, and for any knowledge-practice that depends on the world’s regularities being stable enough to be discovered and applied.

4.11 10S — Multi-Agent World Stratum (Visible Agents)

At 10S, the world contains multiple visible centers of action: agents, not merely objects. The mismatch between D10 (multi-subject synchronization) and E10 (multi-agent rendering) produces a world in which the distinction between other agents and mere objects is visibly present—a world inhabited by others who have perspectives, who act from their own structural centers, and whose behavior cannot be fully predicted from the rules of 9S alone because it is co-generated by a structural center that is not merely a passive element of the field.

10S is the Stratum-foundation of social reality. The visible world at 10S is not merely a world with agents in it; it is a world whose structure has been altered by the presence of multiple structural centers, each contributing to the mismatch-configuration that constitutes the visible world.

4.12 11S — Coordinated World Stratum (Feedback and Coherence)

11S is the world that appears dynamically self-consistent: systems regulate themselves, feedback maintains equilibrium, and the multiple agents of 10S appear to operate within a framework that sustains overall coherence rather than degenerating into disorder. The mismatch at 11S—between D11 (feedback structure) and E11 (feedback rendering)—produces a visible world in which the appearance of regulation is structural, not merely contingent.

4.13 12S — Render-Law World Stratum (Meta-Regularity)

12S is structurally distinct from the surrounding Strata in the same way that 12E is distinct from the surrounding Emanations: it is the meta-level of the visible world's regularity. The world at 12S appears to have consistent rules of appearance—not merely rules within the world (9S) but rules governing how the world appears at all. This is the visible counterpart of the rendering-engine function of 12E, and it manifests in the visible world as a kind of second-order regularity: the sense that not only do things behave consistently, but the very conditions of visibility are consistent.

4.14 13S — Multi-Scale World Stratum (Layered Appearance)

13S is the world that appears simultaneously at multiple scales. The mismatch between D13 and E13 (layered rendering) produces a visible world with nested structure: microscopic and macroscopic regularities that are both present in the visible world, each with its own character, neither reducible to the other, but both recognizable as aspects of the same world. The visible world at 13S is not flat; it has depth in the sense of scale-depth.

4.15 14S — Cross-Scale Identity Stratum (Translation Consistency)

14S is the world in which things appear consistent across scales. An entity that appears at the microscopic level appears to be the same entity—recognizably so—at the

macroscopic level. The mismatch at 14S produces a visible world in which scale-translation is coherent: zooming in or out does not encounter an entirely different world but reveals more structure of the same world-body. This is the visible condition for the unity of scientific explanation across levels of organization.

4.16 15S — Unified World-Body Stratum (Integrated Appearance)

15S is the world that appears unified. The multiple scales of 13S and the cross-scale identity of 14S are integrated at 15S into a single visible world-body: despite the multiplicity of agents, perspectives, scales, and structural levels, the world appears as one world. This is the visible condition for the phenomenological sense of being in a single shared reality—the basis of intersubjective agreement, shared reference, and common experience.

4.17 16S — Global World Stratum (Whole-World Coherence)

16S is the world that appears as a totality. Where 15S produces the unity of the world-body at the level of integration, 16S produces the appearance of the world as a whole with global structure—the sense that there is a cosmos, that the world’s parts cohere not merely locally but at the scale of the entire system. This is the visible Stratum-ground for cosmological thinking and for any representation of the totality of what exists.

4.18 17S — Narrative World Stratum (Story-Like Appearance)

At 17S, the world acquires visible narrative structure. Events do not merely succeed one another causally (6S) and temporally (4S); they appear as part of a developing story with direction, trajectory, and meaning-in-sequence. The mismatch between D17 (structural continuity) and E17 (narrative rendering) produces a visible world in which the distinction between what has happened and what is happening and what might happen next has the character of a story unfolding rather than merely a causal sequence proceeding.

Narrative appearance is not confined to human experience. It is a structural property of the 17S mismatch-configuration that becomes most pronounced when the visible world already contains agents (10S), but its structural ground is independent of the agentive structures that make it salient.

4.19 18S — Agentive World Stratum (Visible Will and Action)

18S is the world in which actions appear to originate from within agents rather than merely to be produced by prior causes. The mismatch between D18 (intentional structure) and E18 (agency rendering) produces a visible world containing visible will: the appearance of self-origination, of initiative, of a structural center from which action issues rather than through which causation passes. This is the visible Stratum-ground for the phenomenology of agency, for the appearance of freedom, and for the social and legal categories that depend on the distinction between acting and merely happening.

4.20 19S — Intentional World Stratum (Purpose and Directedness)

19S is the world in which actions appear purposeful. Where 18S makes visible the origination of action, 19S makes visible its directedness: actions at 19S appear to be toward something, to have a goal-structure, to tend in a direction that is not merely the result of prior causes but the expression of an intention. The mismatch at 19S produces a visible world containing teleological structure—purpose appearing as a real property of visible processes and not merely as a retrospective interpretation imposed on causal sequences.

4.21 20S — Value-Structured World Stratum (Importance and Preference)

20S is the world structured by visible value. The mismatch between D20 and E20 produces a visible world in which the distinction between better and worse, more and less important, more and less desirable is a structural feature of the visible world-body rather than a merely subjective overlay. Things appear to matter at 20S; the world has visible stakes. This is the Stratum-ground for ethics, aesthetics, and any practice in which the concept of value is operative as a structural rather than merely conventional category.

4.22 21S — Identity-Stable World Stratum (Self-Continuity)

21S is the world containing visible selves—subjects that appear to themselves and to others as continuous identities across time. The mismatch at 21S produces a visible world in which the distinction between being the same person and being a different person is structurally present: subjects have autobiographical coherence, they are recognizable across contexts, and their self-identity is not a moment-to-moment re-establishment but a stable structural feature of their visible presence.

4.23 22S — Meaning-Structured World Stratum (Significance)

22S is the world in which things appear meaningful. This is not the same as the world appearing purposeful (19S) or valuable (20S). Meaning at 22S is the appearance of significance-relations: events appear as meaningful not merely in relation to goals or values but in relation to a broader interpretive framework that situates them within a structure of understanding. The world at 22S does not merely contain events that matter; it contains events that mean something, and the difference between mattering and meaning is structurally present in the 22S mismatch-configuration.

4.24 23S — Meta-Meaning World Stratum (Reflective Significance)

23S is the world in which meaning itself appears as an object of interpretation. The visible world at 23S contains not merely meaningful events but the visible structure of interpretation: interpretive frameworks appear as such, and the question of what something means becomes itself a meaningful question in the visible world. This is the Stratum-ground for philosophy, hermeneutics, and any practice in which the conditions of meaning are brought into view.

4.25 24S — Worldview Stratum (Integrated Interpretation)

24S is the world that appears as coherently interpretable as a whole. The mismatch between D24 and E24 produces a visible world in which value (20S), identity (21S), meaning (22S), and reflective meaning (23S) are integrated into a single coherent interpretive framework—a worldview—that makes the world appear as a whole that can be understood. Not merely understood in parts or locally, but understood as a totality with a consistent structure of meaning.

4.26 25S — Transcendent World Stratum (Framework-Modifiable Appearance)

25S is the world that contains, within its visible structure, the possibility of reframing itself. The visible world at 25S includes the appearance of framework-revision: interpretive structures appear revisable, not fixed; the worldview of 24S appears as one possible interpretive configuration among others rather than as the only possible organization of visible experience. This is the Stratum-ground for philosophical revision, for spiritual

transformation, and for the kind of experience the WLM designates as the subject-offset transition—the moment at which the subject recognizes itself as the container of its interpretive framework rather than merely an element within it.

4.27 26S — Recursive World Stratum (Self-Modifying Appearance)

26S is the world that appears capable of modifying the conditions of its own appearance. At 25S, interpretive frameworks appear revisable; at 26S, the structural conditions that make any interpretive framework possible appear revisable. The visible world at 26S contains the appearance of radical self-transformation: not merely changing one's beliefs or framework but revising the structural ground on which all frameworks stand. This is the most structurally demanding Stratum before closure, and it corresponds to what contemplative traditions designate as the most fundamental level of transformation available within the manifest world.

4.28 27S — Completion World Stratum (Full Manifestation)

27S is the final and closing Stratum: the visible world in its condition of complete structural expression. The mismatch between D27 (Closure) and E27 (Closure Rendering) produces a visible world that appears fully expressed—structurally exhausted in the specific sense that the generative arc has been fully traversed. Nothing further remains to emerge; the world has said everything it has to say in the register of visible structure. The world-feeling of 27S is the appearance of completion: not emptiness, not dissolution, but the felt sense of a generative cycle that has arrived at its structural endpoint.

The relation between 27S and 0S completes the cycle. 0S is the pre-world condition: no mismatch, no world-body, no visible presence. 27S is the completion-world condition: maximum visible presence, the world fully expressed. The structural return from 27S to 0—designated by the closure seal $S \rightarrow 0$ —is not a return to nothing but a return to the generative ground: the pre-world condition that contains, in structural potentiality, the entire arc that 0S through 27S has made visible.

5. Global Patterns of the Stratum Layer

5.1 The Four-Phase Arc

The structural logic of the 0S–27S sequence can be read at the level of its four-phase arc. The offset phase (0S–3S) establishes the minimum visible conditions for world-existence: the pre-world ground, the first visible trace, the gradient of contrast, and the threshold of stable world-body formation. These four Strata are foundational in the literal sense: no higher Stratum is structurally possible without them, because no higher Stratum can generate a visible world-body that has not first achieved the stability threshold of 3S.

The polarity phase (4S–9S) develops the basic visible structure of the physical world: time, determinacy, causality, space, objects, and law. These six Strata together constitute what might be called the visible physics of the world—the structural conditions for a world that has temporal flow, causal order, spatial extension, persistent things, and regular behavior.

The recursion phase (10S–26S) is the longest and most structurally complex phase. It begins with the appearance of multiple agents (10S) and moves through coordination, meta-regularity, multi-scale structure, unity, global coherence, narrative, agency, intention, value, identity, meaning, reflective meaning, worldview, framework-revision, and self-modification. The structural logic of this phase is one of increasing self-reference: each level makes visible a more reflexive aspect of the world’s structure than the level before it.

The closure phase (27S) is a single Stratum, which is structurally appropriate: closure is a point, not a phase. The full visible expression of the generative arc is achieved at a single structural endpoint, beyond which the return to ground ($S \rightarrow 0$) is the only remaining structural movement.

5.2 The Asymmetry of the Sequence

One notable feature of the 0S–27S sequence is the asymmetry between the offset and polarity phases (which together span only nine Strata) and the recursion phase (which spans seventeen). This asymmetry reflects a genuine structural fact: the conditions for a minimal visible world are relatively few, but the elaboration of that world through higher-order visible structures—agency, meaning, self-reference—involves a much larger structural space. The visible world does not become complex gradually; it remains relatively simple through the polarity phase and then undergoes rapid elaboration as the recursion phase introduces agency and its consequences.

5.3 The Stratum Layer as the Mirror of Both D and E

The Stratum layer is, simultaneously, the visible output of the Dimension layer and the visible output of the Emanation layer. It mirrors D in the sense that each S-level corresponds to a D-level: the visible world at each Stratum reflects the structural configuration at the corresponding Dimension. It mirrors E in the sense that each S-level is produced by the rendering mechanism of the corresponding Emanation: the visible world at each Stratum is shaped by the rendering loss that the corresponding Emanation introduces.

But the Stratum is not the sum of D and E, nor their average, nor their intersection. It is their mismatch—the stable gap between them—and this is what makes it irreducible to either. The visible world is neither bare structure nor bare rendering; it is what remains when structure is rendered with constitutive loss and that loss stabilizes into a coherent world-configuration.

6. Implications of the Strata Spectrum

6.1 The WLM Account of World-Experience

The 0S–27S account provides a structural basis for understanding the full range of world-experience. At the lower end of the sequence, the experience of raw perceptual fields (2S–3S), of temporal flow (4S), of causal constraint (6S), and of spatial extension (7S) are grounded in the Stratum-level mismatches corresponding to those structural features. At the higher end, the experience of meaning (22S), of interpretive frameworks (23S–24S), and of framework-revision (25S–26S) are equally grounded in Stratum-level structure—not as cultural overlays on a purely physical world but as structural features of the visible world at the levels of mismatch that produce them.

6.2 Implications for the Buddhist Structural Parallels

The WLM framework notes two Buddhist structural parallels in the Stratum theory. The first is *nāmarūpa* (name-and-form), which corresponds to 3S: the first stable formation of S, the threshold at which a world-body becomes possible. The second is *āvidyā* (ignorance), which corresponds to the structural deviation of S from a hypothetical perfect transparency—the constitutive mismatch that makes the world appear as it does rather

than as the dimensional structure it is. The $S \rightarrow 0$ closure condition corresponds to what the tradition designates as liberation or nirvana: not the destruction of the visible world but the structural return of S to its generative ground.

These parallels are structural, not hermeneutical. The WLM framework does not claim to interpret Buddhist doctrine; it claims to identify a structural isomorphism between the WLM account of world-generation and certain core structural claims of the Buddhist analysis of conditioned existence.

6.3 The Complete Three-Layer Picture

With the Stratum paper, the three-layer ontological account of the World Layer Model is complete. D generates invisible structure through the recursive offset-polarity-closure process. E renders that structure through a mechanism that is constitutively lossy. S is the visible world that results from that rendering—the stable mismatch between D and E. All three layers are co-present in every world-state; they are not sequential but simultaneous structural aspects of a single generative process.

The formal relationship among them can be stated compactly:

$$S = \Delta(D, E) \tag{6.1}$$

where D is the invisible structural ground, E is the invisible rendering mechanism, and S is the only visible layer—the world as it appears, the world as it is inhabited and experienced and known. The three-layer picture does not reduce any of these to any other; it accounts for their co-presence and their structural interdependence.

7. Conclusion

The Stratum spectrum from 0S to 27S constitutes the visible-world architecture of the World Layer Model. It runs from the pre-world ground (0S), at which no mismatch has opened and no world-body has formed, through the complete elaboration of visible world-structure—physical, agentive, meaningful, self-referential—to the completion-appearance of 27S, at which the generative cycle has reached its visible endpoint. The fundamental

principle throughout is the mismatch ontology: the visible world is not structure, not rendering, but the stable gap between them. $S = \Delta(D, E)$.

Together with the prior papers on the Dimension layer (D0–D27) and the Emanation spectrum (0E–27E), this account completes the three-layer ontological foundation of the WLM framework. The architecture is self-consistent and closed: the same generative logic—offset, polarity, recursion, closure—governs all three layers, and the three layers jointly determine the visible world without reduction of any to any other.

Subsequent work will address the interface dynamics between layers, the formal properties of the mismatch function Δ , and the structural account of the $S \rightarrow 0$ transition in relation to the phenomenology of closure-states described across contemplative, psychological, and structural traditions.
